Anti-Wrinkle Exfoliating Cleanser

FAQ's

Isn't a 10% glycolic acid product too irritating for twice a day use?

Normally 10% glycolic acid would be too exfoliating for twice a day use, but HydroPeptide® Cleanse uses a buffered Glycolic Acid. Buffering takes the acid and increases the pH without changing the percent concentration. This results in our product with 10% Glycolic Acid being less irritating than a grocery store brand at 3%. Buffering does not make it less effective but makes exfoliation less visible.

Why does this product contain peptides? Aren't they just rinsed away?

HydroPeptide® Cleanse contains massaging Jojoba beads that are massaged on skin for 1 to 2 minutes while cleansing. This allows for its peptides to penetrate the skin while cleansing and exfoliating.

Why doesn't this cleanser foam?

Foaming cleansers tend to dry out this skin. Keeping skin hydrated is essential to an anti-aging regimen and especially more mature skin types. Cleanse was designed to keep skin hydrated and not strip away the natural moisture of the facial skin.

Will this cleanser remove my makeup?

Cleanse can effectively remove most types of makeup. Some types of makeup and waterproof mascara may require the use of an additional make up remover.
