

SPF 30 ✦☂💧🛡️ Anti-Wrinkle Skin Enhancing UV Protection

FAQ's:

Why doesn't SPF 30 contain peptides?

Peptides are designed to penetrate deep within the skin to help increase signals for collagen production. SPF is designed to stay on the surface and act as a physical blocker against UV rays. SPF 30 and peptides cannot be truly effective in a formula together. Peptides will not penetrate to where they need to be and thus driving up the cost of the product without delivering the expected results.

Should I apply a moisturizer with SPF 30?

SPF 30 does contain Glycerin, Aloe and Niacin which will lightly hydrate the skin. If skin is not sufficiently hydrated, another moisturizer can be applied before applying SPF 30. SPF 30 should be applied after treatments and moisturizers but before makeup.
