## Anti-Wrinkle Brightening Toner

### FAQ's

Is a toner necessary?

If makeup use is heavy or if skin feels oily, a toner can remove any last traces of debris and balance skin. Toners can also smooth skin, lightly hydrate, provide antioxidant protection as well as improve the penetration of treatment creams and serums that follow its application. HydroPeptide® Tone does all this and is designed as a treatment that will also brighten skin tone.

Will this toner dry out my skin?

No. Tone does not contain alcohol which is known to strip away natural moisture and cause a dry, tight feeling. In fact, Tone contains Hyaluronic Acid (also called Sodium Hyaluronate) that acts as a humectant to pull hydration into the surface layers of the skin.

What ingredients reduce pore size?

Enlarged pore size can be due to a number of factors. Blackheads, too much surface oil, lack of proper exfoliation, and sun damage are the main culprits. Tone uses topical Vitamin A (Retinyl Palmitate) and Alpha Hydroxy Acid (Lactic Acid) to help to restore proper exfoliation while Geranium to act as an astringent that soaks up excess oil production and draws freshly cleansed pores closed.

How does Tone lighten sun damage?

Tone uses natural skin lighteners that reduce the abnormal production of pigment-controlling enzymes tyrosinase. Lightening results can be seen between 30 to 60 days.
