

WHAT IS HYPERPIGMENTATION?

Melanin is the natural pigment that gives color to skin. Hyperpigmentation occurs when the body produces excess melanin in response to UV exposure, hormonal fluctuations, or trauma to the skin such as acne.

THE SOLUTION:

PIGMENT REGULATOR

DAILY HIGH POTENCY BRIGHTENING TREATMENT

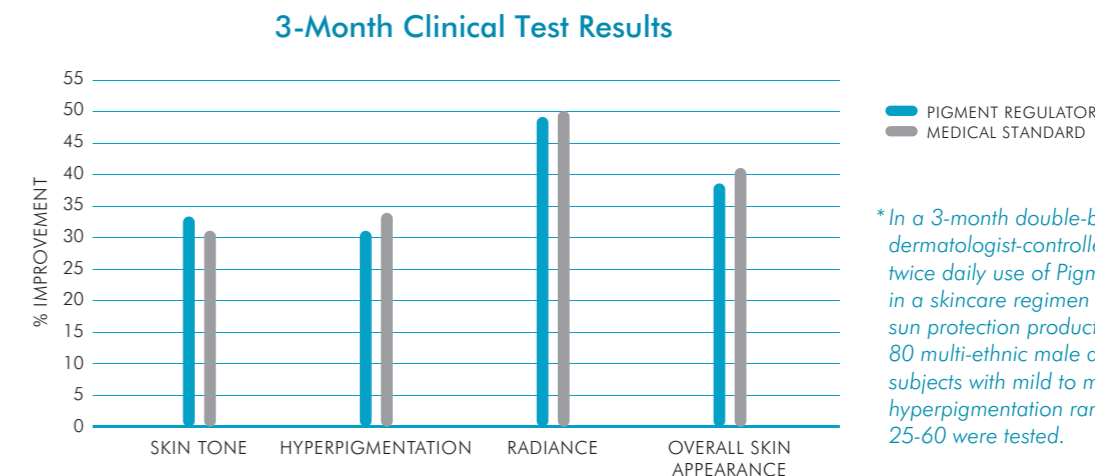

POTENT RESULTS.

As effective as the medical standard for the topical treatment of hyperpigmentation.

Pigment Regulator provides powerful skin brightening results and is a safe and well-tolerated exfoliating treatment alternative to the medical standard.

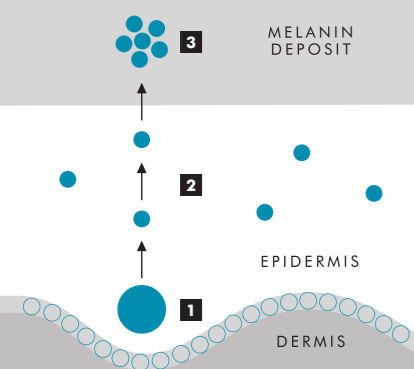

PIGMENT REGULATOR VS. THE MEDICAL STANDARD FOR THE TOPICAL TREATMENT OF HYPERPIGMENTATION.

Similar brightening abilities have been found between the two products*.

**In a 3-month double-blind, dermatologist-controlled study, twice daily use of Pigment Regulator in a skincare regimen including a sun protection product. 80 multi-ethnic male and female subjects with mild to moderate hyperpigmentation ranging in age from 25-60 were tested.*

Hyperpigmentation normally occurs through a 3-step process:

- 1** Too much melanin is produced in the bottom of the epidermis
- 2** The excess melanin travels to the top of the epidermis
- 3** It then clusters together on the skin's surface forming visible hyperpigmentation such as brown spots, freckles, and dark patches

Enriched with Kojic Acid, Emblica and 10% exfoliants, Pigment Regulator helps to combat the steps leading to hyperpigmentation. It breaks up and removes melanin clusters on the skin's surface, reducing the appearance of existing hyperpigmentation while protecting it from future discolorations. Clinically proven results. Skin looks brighter and more even toned.

VISIBLE RESULTS CLINICALLY PROVEN ON FACE, DECOLLETE & HANDS

- Brown spots, age spots and traces of acne past appear visibly reduced
- Global uniformisation of skin tone
- Protects against future discoloration
