

Why do you use the DermaTx Applicator with the Microdermabrasion cream?

DermaTx Microdermabrasion Creams were developed for use with the DermaTx hand-held skin resurfacing tool which utilises micro-pulse vibrating technology to gently massage the skin.

Most exfoliants that are sold without tools claim to be effective, but are they are actually quite ineffective compared to the tool-based DermaTx Microdermabrasion Systems.

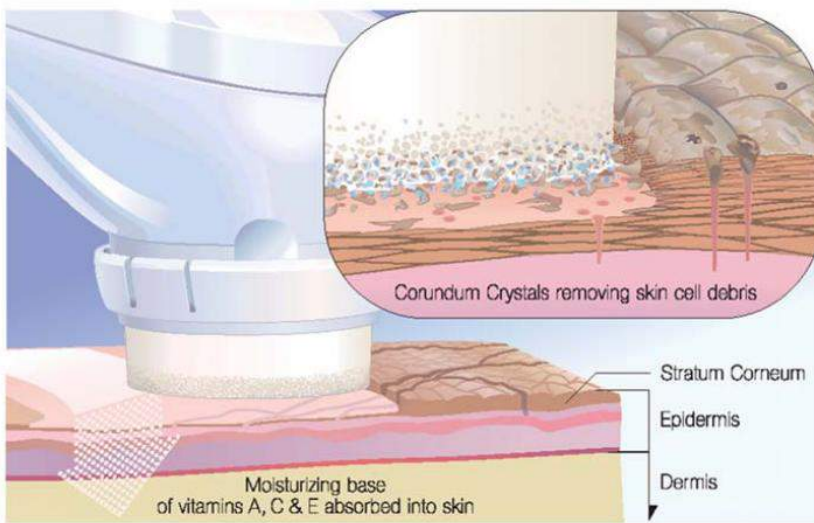

The carefully selected exfoliating foam head is designed for use with the DermaTx Microdermabrasion Creams. The massaging action of this attachment allows the corundum crystals in the creams to gently exfoliate the skin, and enables the ingredients to be absorbed more easily.

When DermaTx Microdermabrasion Cream is applied using this microdermabrasion foam attachment, the crystals in the cream become embedded in the "micropores" of the foam. This ensures that the crystals move evenly over the surface of the skin for maximum refining capabilities and an exceptionally smooth and gentle action.

Micro-massaging of the corundum crystals in DermaTx Microdermabrasion Creams provides a superior microdermabrasion treatment, and allows the ingredients to penetrate deeper into the skin.

DermaTx® Microdermabrasion is a tool-based system using micro-pulsing technology for a superior exfoliating effect. The massaging effect allows the professional grade crystals to remove dead skin cells and gently polish dull skin, enabling active ingredients to penetrate deeper into the new skin for a beautiful, silky soft, glowing complexion.

Prepping your skin with microdermabrasion can immediately result in a more revitalised and glowing complexion. Microdermabrasion removes dead skin cells, which also allows make-up to sit better on the skin for a flawless look.
