

ANTI-AGE Spray

Hyalual® DailyDeLux

For beautiful skin and your radiance every day!

BREATHE YOUTH INTO YOUR SKIN WITH THE SPECIAL DAILY-USE SPRAY

Hyalual® Daily Delux gives you magnificent looking skin, and a shining look every day. Here are some of the benefits of using Hyalual Daily Delux:

- Preserves the natural moisture of the skin
- Increase the free water content of the stratum corneum and helps to reduce water evaporation from the skin surface
- Provides deep cleansing of the skin
- Enriches skin with minerals
- Enriches cells with oxygen and removes toxins
- Promotes rapid skin renovation, strengthens skin tissue and tightens the skin, renewing skin cells
- Improves the capillaries microcirculation

Innovative Anti-Age Spray

Aggressive cosmetic procedures disrupt the integrity of the epidermal barrier, allowing biologically active substances to form a continuous thin film, penetrating the skin more deeply and exerting a pronounced therapeutic effect. This is the core principle of Hyalual® Daily DeLux, an innovative combination preparation of hyaluronic and amber acid.

Hyaluronic acid is known for its ability to form a continuous thin film on the skin surface, which allows the skin to preserve its natural moisture and does not interfere with the gas exchange. As a result, a kind of 'hydrostorage' is created inside the epidermis, which not only improves the appearance of the skin (evening out the skin colour and relief, and providing for a lifting effect), but enhances the functional activity of keratinocytes and restores the skin's protective function. Hyaluronic acid is capable of maintaining homeostasis, causing a local regenerative and immunostimulatory effect, and improving intercellular information exchange. The epidermis lacks blood vessels, but water, as well as hyaluronic acid, provides for transport of oxygen and nutrients. Hyaluronic acid not only serves as a three-dimensional trap for free radicals, but contributes to their deactivation.

Amber acid and its salts belong to intracellular metabolites. Amber acid is a non-toxic natural compound. It is contained in all tissues and organs, and is classified as a biotic, being a product of the tricarboxylic acid cycle. This acid combines the properties of an active antioxidant and antihypoxant. The biological role of amber acid is many-sided. It affects the Krebs cycle by lowering the production of lactate and pyruvate formed in hypoxic conditions and making energy exchange more economic.

Amber acid normalizes the levels of histamine and serotonin inflammatory mediators, and improves microcirculation in organs and tissues without altering the systemic hemodynamics. When injected externally, succinate has a moderate antihypoxic effect, improving utilization of circulating oxygen and increasing resistance to hypoxia (which is especially important for smokers and urban dwellers).

As part of the innovative combination preparation Hyalual® Daily DeLux, hyaluronic and amber acids facilitate delivery of the active components of cosmetics to their immediate effect zones, therefore improving the effectiveness of home and professional skincare. The drug's components are entirely skin-compatible and cause no allergy or irritation.

Hyalual® Daily DeLux is used as part of combination therapy to prevent and correct age-related skin changes, together with intradermal injections of Hyalual containing hyaluronic acid (11, 18 or 22 mg/ml) and sodium succinate (1.6% or 16 mg/ml). This treatment works on several levels (epidermis and dermis) and affects all of the main etiopathogenetic mechanisms of skin ageing. The addition of sodium succinate results in a considerable increase in the drug's antioxidant and anti-inflammatory properties, as well as its ability to stimulate metabolic processes, restore microcirculation, increase skin elasticity and turgor, and even out its colour and texture.

INDICATIONS:

- **Skin dryness & pronounced dehydration;**
- **Prevention & treatment of photo- and chrono-ageing of the face and body skin;**
- **Preparation for aggressive cosmetic procedures & rehabilitation after them;**
- **Additional skin care for smokers;**
- **After cosmetic procedures, including invasive ones.**

APPLICATION

The spray is applied to the face and body skin 10-15 minutes after applying the regular cream or serum, so that their therapeutic effect takes place before they are washed out. Avoid direct contact with the eyes. When planning a procedure that destroys the corneous layer of the skin (peeling, dermabrasion), moisturising the skin with the active ingredients is pointless, so in those cases treatment with Hyalual® Daily DeLux is started after the procedure, beginning from day 3 (excluding the re-epithelisation period), and during the rehabilitation period. For procedures where the corneous layer is preserved, moisturizing the skin during the preparatory period considerably increases its effectiveness. In such cases, it is recommended to use the spray during 2 weeks preceding the procedure, for daytime and evening care, on top of the regular cream or serum. In the period following the procedures that preserve the corneous layer, the spray should be used at least 3 times daily during 4 days, then 2-3 times daily. During the rehabilitation period, for all skin types, the spray should be used 2-3 times per day during 1-3 months, starting from day 3.

For greasy and combination skin, the spray can be used in autumn and winter, once per day, when signs of dry epidermis become apparent. When using Hyalual® Daily DeLux to prevent photo- and chrono-ageing, take care of dry and dehydrated skin, and as additional skin care for smokers, it should be used 2-3 times daily. When used for treatment and prevention of photo- and chrono-ageing, the spray not only decreases the harmful impact of UV radiation, but also facilitates physiological restoration of the corneous layer and the micro vascular system of the dermis. This cosmetic preparation provides the skin with a second wind without any risk.

The use of Hyalual® Daily DeLux spray in anti-ageing programmes allows to increase the effectiveness of the treatment and achieve a prolonged effect.
