

MelaClear - Sunscreen SPF 50+

Over exposure to the sun can lead to a range of skin problems, the most serious of which is skin cancer.

UV radiation penetrates the earth's atmosphere in two wavelengths UVA and UVB.

UVA radiation penetrates deeper in the skin than UVB and can damage collagen and elastin leading to sun-induced skin ageing and areas of hyperpigmentation. UVA protection in a sunscreen helps defend the skin against photo ageing and potentially skin cancer also.

UVB radiation causes sunburn. Sunscreens are labeled with an 'SPF'. This stands for 'sun protection factor' which is the amount of protection against sunburn a sunscreen will provide.

MelaClear Sunscreen SPF 50+ is an expertly formulated, cosmetically elegant sunscreen which provides;

Maximum protection

MelaClear Sunscreen SPF 50+ with its high content of advanced mineral sunscreen filters provides maximum protection against UVA & UVB radiation.

Complexion enhancement

MelaClear Sunscreen SPF 50+ contains carefully selected skin tinting agents which blend evenly and smoothly with the majority of skin tones to provide a natural looking tint to the skin.

In addition these skin tints reduce the appearance of skin blemishes and can also reduce the need to apply additional products such as foundations and concealers.

MelaClear Sunscreen SPF 50+ also contains high levels of skin conditioning agents.

Directions for use

Before sun exposure (approx 20 minutes) apply generous amounts of sunscreen over the entire face and neck. Ensure sunscreen is rubbed in well. Re-apply frequently (approx every 2 hours) and particularly after swimming. Avoid exposure during maximum sunshine hours.

When used in conjunction with **MelaClear serum**, apply serum first and allow to absorb. Once serum is absorbed apply **MelaClear Sunscreen SPF 50+**.

MelaClear Sunscreen SPF 50+ is water resistant and suitable for all skin types.

AESTHETICARE® Can help.

MelaClear Intense Depigmenting Care

MelaClear - Intense Depigmenting Care

Hyperpigmentation is a common condition in which areas of skin, often the face, develop dark spots or patches. Common forms are known as 'age-spots', 'liver spots', and freckles. Larger areas of darkened skin are known as melasma.

Darkening of the skin occurs when an excess of melanin (the brown pigment that produces normal skin colour) forms deposits in the skin. The main causes of this effect are sun damage, skin inflammations, acne and hormonal changes.

MelaClear - an intense depigmenting care serum has been expertly formulated to prevent and reduce melanin production and enhance and lighten hyperpigmented skin.

With regular twice daily use over a 2 month period **MelaClear serum** 'mops up' the free radicals that trigger melanin synthesis, blocks and reduces melanin production and significantly increases exfoliation of hyperpigmented cells clearing and renewing the skin.

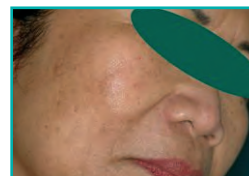

In addition **MelaClear serum** provides essential anti-ageing treatment increasing collagen formation and photo-damage repair.

Before and After Melasma

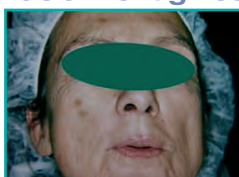

Before treatment

2 months treatment using **MelaClear**

Facial Lentigenes

Before treatment

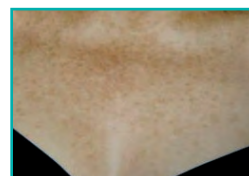

2 months treatment using **MelaClear**

Decolleté Lentigenes

Before treatment

2 months treatment using **MelaClear**

Directions for use

MelaClear depigmenting care serum should be applied twice daily to the area of hyperpigmentation.

Disperse a drop of serum onto your finger and gently massage into the required area and allow to absorb. Continue to apply in the same manner to all areas that require treatment.

MelaClear serum penetrates rapidly and leaves the skin feeling soft and conditioned. Use for 2 to 3 months is often required to achieve the desired visible effect with the first visible response taking approx 4 to 6 weeks.

Avoidance of prolonged exposure to sunlight and use of **MelaClear Sunscreen SPF 50+** is highly recommended.
