

Thank you for your Oxygenetix purchase. To keep your product fresh from first pump to last we have incorporated the use of an airless pump. On occasion it may take several pumps to get it started the first time you use it.

On rare occasion it may need a little extra help. Don't worry if this happens, it is an easy fix and you'll be applying your foundation in no time.

Just flip the bottle over, make sure the cap is on give it a few firm taps into the palm of your hand then give the pump another try.

## How to keep airless pump pumping.

Both the Oxygenetix moisturizer and foundation use a unique Airless Pump system. This means there is no dip tube. As the product is pumped out the Trace follows it up the inside of the container. If the container gets warm or if it is bumped the trace can move back down making pumping out the product difficult. The fix, simply invert the bottle and tap to bring the contents back to the pump area. The reason we use this package is so the consumer can get the maximum amount of product out of the bottle.

← Airless pump required no dip tube.

← Trace that follows product up the inside of the container
